

Episode 1: Initializing Gno

-  Installing Gno
-  Setting up a local environment

 Helpful links available in the episode description

Prerequisites

Basic programming knowledge

Understanding of Blockchain / Web3 fundamentals

What is **Gno.Land**?

-  A **Layer 1** Blockchain
-  Uses **Gno language** — an interpreted version of Go
-  Focus on readable, open-source smart contracts

Core Components

- **Realms** → Smart contracts
- **Packages** → Reusable libraries

Native Token: **GnoT**

Go Environment Setup

If Go isn't already set up, add the following to your shell config:

```
# For bash, zsh, etc.  
export PATH=$PATH:$HOME/go/bin
```

```
# For fish shell users  
set -gx PATH $PATH $HOME/go/bin
```

 Restart your shell for the changes to take effect.

Coming Up in Episode 2

✨ Build a basic Realm (smart contract) 🚀 Deploy locally using `gnodev`

📦 Understand the `gnomod.toml` system 🌐 Interact with Gnoweb ✍️ Write and run smart contract tests

📌 **Example Project:** Mini social application
