

## 2 - Hello Gno World

---

What's Gno language?

Build and test your first dApp

Learn Gno basics • Build a mini dApp • Practice testing and good design

# Gno vs Go

- Familiar **syntax** and **standard library**

## Key differences:

-  **Deterministic execution**
-  Built-in **smart contract support**
-  **No external network access**
-  **No goroutines** (yet!)

# Let's Build a Public Blog Platform

## Features:

- A **public post feed** (anyone can post)

```
type Post struct {  
    Title      string  
    Content    string  
    Author     std.Address  
    CreatedAt  time.Time  
}
```

# Let's Code It!

## Important Concepts

### Embrace global state

Realms *are* global — use them like APIs for shared data.

### Fail fast with `panic`

Panic when assumptions break — stop execution and protect contract state.

### Design for readability

Code clarity beats cleverness — smart contracts are public infra.

## Coming Next

-  Deploy and test your smart contract
-  Securely manage keys
-  Interact with testnet
-  Invoke contracts safely

 Apply what you've learned in real-world scenarios!
